

CANNON[®] GLASS CAPILLARY VISCOMETERS

 **CANNON**
INSTRUMENT COMPANY[®]

CANNON® GLASS CAPILLARY VISCOMETERS SIZE, RANGES, & EXPANDED UNCERTAINTY

Glass Capillary Viscometers

Why does CANNON offer so many different types of glass capillary viscometers? Primarily because no single capillary viscometer is ideally suited for all kinematic viscosity determinations. Individual analysts also have their own preferences. The brief descriptions on the following page may assist you in determining which viscometer is most appropriate for your particular application. Feel free to contact CANNON with your questions. Our experienced staff will be happy to assist you.

Expanded Uncertainty

Instead of listing the precision of our glass capillary viscometers, we now provide the expanded uncertainty. This is the universally accepted statistic when dealing with calibration data. In order to maintain A2LA accreditation, we are required to determine and specify the expanded uncertainty for all our calibration data.

ISO publications define expanded uncertainty as "quantity defining the interval about the result of a measurement within which the values that could reasonably be attributed to the measurement may be expected to lie with a high level of confidence."

Our use of expanded uncertainty instead of precision does not reflect any change in the accuracy or quality of our viscometers. It is a statistical term that is more comprehensive than precision. When comparing the accuracy of viscometers it is essential that the expanded uncertainty be specified.

A certificate specifying the expanded uncertainty is provided with every calibrated viscometer. We also provide such a certificate with every bottle of viscosity standard.

Specifications for CANNON® Viscometers

Table 1

Cannon-Fenske,
Cannon-Ubbelohde, and
Cannon-Ubbelohde Dilution
Viscometers

Size	Approx. constant, cSt/s	Range centistokes*
25	0.002	0.5 to 2
50	0.004	0.8 to 4
75	0.008	1.6 to 8
100	0.015	3 to 15
150	0.035	7 to 35
200	0.1	20 to 100
300	0.25	50 to 250
350	0.5	100 to 500
400	1.2	240 to 1200
450	2.5	500 to 2500
500	8	1600 to 8000
600	20	4000 to 20 000
650	45	9000 to 45 000
700	100	20 000 to 100 000

* Ranges in centistokes represent flow times of 250 to 1000 seconds for Size 25, and 200 to 1000 for all other sizes.

Table 2

Ubbelohde Viscometers

Size	Approx. constant, cSt/s	Range centistokes*
0	0.001	0.3 to 1
0C	0.003	0.6 to 3
0B	0.005	1 to 5
1	0.01	2 to 10
1C	0.03	6 to 30
1B	0.05	10 to 50
2	0.1	20 to 100
2C	0.3	60 to 300
2B	0.5	100 to 500
3	1.0	200 to 1000
3C	3.0	600 to 3000
3B	5.0	1000 to 5000
4	10	2000 to 10 000
4C	30	6000 to 30 000
4B	50	10 000 to 50 000
5	100	20 000 to 100 000

* Ranges in centistokes represent flow times of 300 to 1000 seconds for Size 0, and 200 to 1000 seconds for all other sizes.

CANNON® GLASS CAPILLARY VISCOMETERS TYPES & APPLICATIONS

Cannon-Fenske Routine

The Cannon-Fenske Routine viscometer (page 4) is a rugged and inexpensive viscometer that works well if the liquid to be measured is transparent or translucent. In general, if the meniscus (the curvature at the top of the liquid column) can be readily observed through a column of liquid 3-mm in diameter, the Cannon-Fenske Routine viscometer and other transparent-type viscometers (such as the Zeitfuchs Transparent {page 9} and BS/U-Tube {page 11} viscometers) can be used.

Ubbelohde

The Ubbelohde viscometer (page 5) and other suspended level viscometers are also used to measure transparent liquids. Unlike the Cannon-Fenske Routine viscometer, suspended level viscometers possess the same viscometer constant at all temperatures. This property is advantageous when measurements are to be made at a number of different temperatures. CANNON has improved the design of the Ubbelohde viscometer to make a more rugged instrument called the Cannon-Ubbelohde viscometer (pages 5-6). Other suspended level viscometers in this catalog include the BS/IP/SL, BS/IP/SL(S), and BS/IP/MSL viscometers (pages 12-13).

Reverse Flow Viscometers

Special reverse flow viscometers have been designed for testing opaque liquids. Reverse flow viscometers wet the timing section of the viscometer capillary only during the actual measurement. The Cannon-Fenske Opaque (page 4), Zeitfuchs Cross-Arm (page 10), and BS/IP/RF U-Tube viscometers (page 13) are all reverse flow types. Reverse flow viscometers must be cleaned, dried, and refilled before a repeat measurement can be made. By contrast, other viscometer types commonly used to measure transparent liquids allow the same sample to be repeatedly drawn up into the capillary, permitting multiple measurements for verification.

Small Volume Viscometers

In some situations, such as in a clinical laboratory, the amount of liquid available for measurement is quite small. Several viscometers have been designed which require one milliliter or less of liquid. These are referred to as semi-micro or micro viscometers. The Cannon-Manning Semi-Micro (page 8) is a U-tube viscometer that has been modified to measure the kinematic viscosity of samples as small as 1.0 mL. The Cannon-Ubbelohde Semi-Micro viscometer (page 6) is a modification of the standard size Cannon-Ubbelohde viscometer requiring a sample volume of only one milliliter. The Cannon-Manning Semi-Micro Extra Low Change viscometer (page 8) will permit kinematic viscosity determination with as little as 0.5 milliliters of sample.

Dilution Viscometers

Estimates of the molecular size and shape of large polymer molecules can be obtained from kinematic viscosity measurements of dilute solutions of the polymers. The Cannon-Ubbelohde Dilution viscometer (page 6) has an extra-large reservoir which allows polymer solutions to be diluted several times. Dilute polymer solutions frequently appear to exhibit changes in kinematic viscosity when the shear rate is changed. By using the Cannon-Ubbelohde Four-Bulb Shear Dilution viscometer (page 7), measurements can be made at four different shear rates.

Vacuum Viscometers

In most glass capillary viscometers, the samples flow under gravity. When liquids are too viscous to flow readily under gravity, vacuum viscometers may be used to measure viscosity (in mPa·s or cP). In these instruments a vacuum is applied to one end of the viscometer to pull the liquid through the capillary into the timing bulb(s). CANNON offers several types of vacuum viscometers, including the Cannon-Manning Vacuum (page 14), the Asphalt Institute Vacuum (page 14), and the Modified Koppers Vacuum (page 15). Like the Cannon-Fenske Opaque viscometer, these are all "reverse flow" viscometers. Vacuum viscometers require a vacuum that is very accurately controlled. The CANNON DVR-1000 or DVR-1500 Digital Vacuum Regulator is an ideal instrument for maintaining constant vacuum.

CANNON offers many types of glass capillary viscometers that are not listed in our catalog. Examples include Atlantic, Cannon Master and Ubbelohde Master, Cannon-Ubbelohde Filter-Stick Dilution, Fitzsimons, Lantz-Zeitfuchs, Methylcellulose, SIL, and other viscometers. We can also manufacture glass capillary viscometers with customer-specified constants. Please contact CANNON for order information.

ROUTINE & OPAQUE CANNON-FENSKE VISCOMETERS

9721-A50 Series
9721-B50 Series

CANNON-FENSKE ROUTINE VISCOMETERS

Calibrated CFRC Series

For measuring kinematic viscosity of transparent Newtonian liquids, particularly petroleum products or lubricants, according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 7 mL. Require liquid bath depth of 203 mm (8 inches).
- Constants and ranges are as specified in Table 1 on page 2.
- Holder is not supplied. For holders, see 9726-M50 and -M53 on page 15.
- Viscometers with special constants are available by special order at additional cost.

Uncalibrated CFRU Series

Similar to 9721-B50 series, but uncalibrated.

- Holder is not supplied. For holders, see 9726-M50 and -M53 on page 15.

Size	Uncalibrated CFRU Series	Calibrated CFRC Series
25	9721-A50	9721-B50
50	9721-A53	9721-B53
75	9721-A56	9721-B56
100	9721-A59	9721-B59
150	9721-A62	9721-B62
200	9721-A65	9721-B65
300	9721-A68	9721-B68
350	9721-A71	9721-B71
400	9721-A74	9721-B74
450	9721-A77	9721-B77
500	9721-A80	9721-B80
600	9721-A83	9721-B83
650	9721-A86	9721-B86
700	9721-A89	9721-B89

9721-E50 Series
9721-F50 Series

CANNON-FENSKE OPAQUE VISCOMETERS

Reverse-flow type for dark liquids

Calibrated CFOC Series

Reverse-flow type, for measurement of kinematic viscosity of dark Newtonian liquids according to ASTM D 445 and ISO 3104. Permit measurements of liquids whose meniscus cannot be seen at the timing marks when using Cannon-Fenske Routine-type viscometer. Used to measure kinematic viscosity of liquid (cutback) asphalts and road oils at 60°C (140°F) in range of 30 to 6000 centistokes according to ASTM D 2170. Also used to study lubricating oils at low temperatures when investigating the effect of various additives on lubricating and hydraulic oils. External pressure can be applied to vary shear stress and shear rate. Specifications conform to ASTM D 446 and ISO 3105.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 12 mL. Require liquid bath depth of 229 mm (9 inches).
- Size 25 has approximate constant 0.002 cSt/s and range of 0.4 to 2 cSt. Constants and ranges for other sizes are as given in Table 1 on page 2.
- Holder is not supplied. For holders, see 9726-M50 and -M53 on page 15.
- For replacement micro stoppers, see 9726-N98 on page 15.
- Viscometers with special constants are available by special order at additional cost.

Uncalibrated CFOU Series

Similar to 9721-F50 series, but uncalibrated.

- Holder is not supplied. For holders, see 9726-M50 and -M53 on page 15.

Size	Uncalibrated CFOU Series	Calibrated CFOC Series
25	9721-E50	9721-F50

500	9721-E80	9721-F80
600	9721-E83	9721-F83
650	9721-E86	9721-F86
700	9721-E89	9721-F89

SUSPENDED LEVEL UBBELOHDE VISCOMETERS

9721-N50 Series
9721-R50 Series
9721-U50 Series

UBBELOHDE VISCOMETERS Calibrated UBC Series

For measurement of kinematic viscosity of transparent Newtonian liquids by suspended level principle as described in ASTM D 445 and D 446, and ISO 3104 and 3105. Similar to Cannon-Ubbelohde but less rugged in design.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 11 mL. Require liquid bath depth of 241 mm (9.5 inches).
- Constants and ranges are as specified in Table 2 on page 2.
- Holder is not supplied. For holder, see 9726-M82 on page 15.

Uncalibrated UBU Series

Similar to 9721-R50 series, but uncalibrated.

- Holder is not supplied. For holder, see 9726-M82 on page 15.

Ubbelohde Unity Factor Calibrated UBXC Series

Similar to 9721-R50 series, but with constant within $\pm 0.2\%$ of values listed in Table 2 on page 2. Provided with certificate of calibration and instruction sheet.

- Holder is not supplied. For holder, see 9726-M82 on page 15.

CANNON-UBBELOHDE VISCOMETERS

Calibrated CUC Series

Suspended level viscometer for measurement of kinematic viscosity of transparent Newtonian liquids according to ASTM D 445 and ISO 3104. Also used for evaluating jet and hydraulic lubricants. Especially suited for use at temperatures above 93°C (200°F) or below -18°C (0°F). Require no kinetic energy corrections over 0.5 to 100 000 centistokes range. Viscometer constant is same at all temperatures. Specifications conform to ASTM D 446 and ISO 3105.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 11 mL. Require liquid bath depth of 254 mm (10-inches); must be submerged to approximately 220 mm (8.5-inches).
- Constants and ranges are as specified in Table 1 on page 2.
- Holder is not supplied. For holders, see 9726-M70, -M73, and -M76 on page 15.

Uncalibrated CUU Series

Similar to 9721-K50 series, but uncalibrated.

Holder is not supplied. For holders, see 9726-M70, -M73, and -M76 on page 15.

SEMI-MICRO & DILUTION CANNON-UBBELOHDE VISCOMETERS

9722-G50 Series
9722-H50 Series

CANNON-UBBELOHDE SEMI-MICRO VISCOMETERS

Semi-Micro Calibrated CUSMC Series

For measuring kinematic viscosity of small samples of transparent Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105. Viscometer constant is same at all temperatures.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume approximately 1.0 mL. Sizes 400 through 600 may require larger sample volume. Initial sample can be diluted to as much as 20 mL for intrinsic viscosity determinations. Require liquid bath depth of 240 mm (9.5 inches).
- Size 25 has approximate constant 0.002 cSt/s and a range of 0.4 to 2 cSt. Constants and ranges for all other sizes are as given in Table 1 on page 2.
- Holder is not supplied. For holders, see 9726-M70, -M73, and -M76 on page 15.

Semi-Micro Uncalibrated CUSMU Series

Similar to 9722-H50 series, but uncalibrated.

- Holder is not supplied. For holders, see 9726-M70, -M73, and -M76 on page 15.

9722-M50 Series

CANNON-UBBELOHDE DILUTION VISCOMETERS

Dilution Type Calibrated CUDC Series

For measurement of intrinsic viscosity of transparent Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105. Viscometer constant is same at all temperatures.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume of 8 mL can be diluted to 40 mL. Require liquid bath depth of 305 mm (12 inches). The CANNON CT-518 bath is recommended.
- Constants and ranges are as specified in Table 1 on page 2.
- Holder is not supplied. For holders, see 9726-M70, -M73, and -M76 on page 15.

Dilution Type Uncalibrated CUDU Series

Similar to 9722-M50 series, but uncalibrated.

- Holder is not supplied. For holders, see 9726-M70, -M73, and -M76 on page 15.

CANNON-UBBELOHDE FOUR-BULB SHEAR DILUTION VISCOMETERS

9723-L50 Series
9723-M50 Series
9723-N50 Series

CANNON-UBBELOHDE FOUR-BULB SHEAR DILUTION VISCOMETERS

Five-fold dilution type

Calibrated CUSDC-11 Series

For measurement of intrinsic viscosities extrapolated to zero shear rate. Provide five-fold range of shear rates. Design gives extra mechanical strength. Negligible kinetic energy correction.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 20 mL. Require liquid bath depth of 280 mm (11 inches).
- Holder is not supplied. For holders, see 9726-M70, -M73, and -M76 on page 15.

Uncalibrated CUSDU-11 Series

Similar to 9723-M50 series, but uncalibrated.

- Holder is not supplied. For holders, see 9726-M70, -M73, and -M76 on page 15.

Ten-fold dilution type

Calibrated CUSDC-17 Series

Similar to 9723-M50 series, but provide ten-fold range of shear rates.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 20 mL. Require liquid bath depth of 430 mm (17 inches). The CT-518 bath is recommended.
- Holder is not supplied. For holders, see 9726-M70, -M73, and -M76 on page 15.

Uncalibrated CUSDU-17 Series

Similar to 9723-R50 series, but uncalibrated.

- Holder is not supplied. For holders, see 9726-M70, -M73, and -M76 on page 15.

CANNON-MANNING SEMI-MICRO LOW CHARGE VISCOMETERS

9721-X50 Series
9721-Y50 Series

CANNON-MANNING SEMI-MICRO VISCOMETERS

Calibrated CMSMC Series

For measurement of kinematic viscosity of small samples of transparent Newtonian liquids, including petroleum products or lubricants, according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Sample volume approximately 1.0 mL. Sizes 400 through 600 may require more sample. Require liquid bath depth of 200 mm (8 inches).
- Size 25 has approximate constant 0.002 cSt/s and a range of 0.4 to 2 cSt. Constants and ranges for all other sizes are as given in Table 1 on page 2.
- Holder is not supplied. For holders, see 9726-M50 and -M53 on page 15.

Uncalibrated CMSMU Series

Similar to 9721-Y50 series, but uncalibrated.

- Holder is not supplied. For holders, see 9726-M50 and -M53 on page 15.

9722-C50 Series
9722-D50 Series

CANNON-MANNING SEMI-MICRO EXTRA LOW CHARGE VISCOMETERS

Extra Low Charge Calibrated CMSMEC Series

Similar to 9721-Y50 series, but require smaller sample volume of approximately 0.5 mL. Sizes 200 through 600 may require larger volume of sample.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Without holder.

Extra Low Charge Uncalibrated CMSMEU Series

Similar to 9722-D50 series, but uncalibrated.

- Without holder.

CANNON® ZEITFUCHS VISCOMETERS

9723-A50 Series
9723-B50 Series

ZEITFUCHS® TRANSPARENT VISCOMETERS

With permanently attached round metal holder

Calibrated ZTC-RO Series

For measurement of kinematic viscosity of transparent Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105. Filling, measurement, and cleaning can be done without removal from constant temperature bath.

Certificate of calibration and instruction sheet provided. See page 2 for expanded uncertainty.

- Minimum sample volume 15 mL. Require liquid bath depth of 292 mm (11.5 inches).
- For constants and ranges, see table at right.
- Manufactured with permanently attached round metal holder, for hole 51 mm (2 inches) in diameter.

Uncalibrated ZTU-RO Series

Similar to 9723-B50 series, but uncalibrated.

9723-C50 Series
9723-D50 Series

With permanently attached rectangular metal holder

Calibrated ZTC-RE Series

For measurement of kinematic viscosity of transparent Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105. Filling, measurement, and cleaning can be done without removal from constant temperature bath.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 15 mL. Require liquid bath depth of 292 mm (11.5 inches).
- For constants and ranges, see table (above right).
- Manufactured with permanently attached rectangular metal holder which requires a bath opening of 25 x 48 mm (1 x 1.9 inches).

Calibrated ZTU-RE Series

Similar to 9723-D50 series, but uncalibrated.

Specifications for Zeitfuchs® Transparent* & Zeitfuchs® Cross-Arm Viscometers

CANNON® ZEITFUCHS CROSS-ARM VISCOMETERS

9723-S50 Series
9723-U50 Series

CALIBRATED ZEITFUCHS® CROSS-ARM VISCOMETERS

For measurement of kinematic viscosity of transparent and opaque Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105. Also used to measure kinematic viscosity of liquid (cutback) asphalts and road oils at 60°C (140°F) and asphalt cements at 135°C (275°F) in the range of 30 to 6000 centistokes according to ASTM D 2170. Can be filled and cleaned while in constant temperature bath.

- Minimum sample volume 1 to 3 mL. Require liquid bath depth of 230 mm (9 inches).
- Constants and ranges are as described in table on page 9.
- All instruments calibrated. Certificate of calibration and instruction sheet provided. See page 2 for expanded uncertainty. Offered with and without holder as described below.

ZCAC Series

As described above. Without holder.

- For holder, see 9726-M95 and -M98 on page 15.

Unity Factor ZCAXC Series

Similar to 9723-S50 series, but have constant within ± 0.2% of values listed in table on page 9.

- For holder, see 9726-M95 and -M98 on page 15.

With permanently attached round metal holder

ZCAC-RO Series

As described above. Supplied with permanently attached round metal holder, for hole 51 mm (2 inches) in diameter.

Unity Factor ZCAXC-RO Series

Similar to 9723-W50 series, but have constant which is within ± 0.2% of values listed in table on page 9.

With permanently attached rectangular metal holder

ZCAC-RE Series

As described above. Supplied with permanently attached rectangular metal holder which requires bath opening 25 x 48 mm (1 x 1.9 inches).

Unity Factor ZCAXC-RE Series

Similar to 9724-B50 series, but have constant within ± 0.2% of value listed in table on page 9.

CANNON® BS/U-TUBE VISCOMETERS

9724-E50 Series

BS/U-TUBE VISCOMETERS FOR TRANSPARENT LIQUIDS

For measurement of kinematic viscosity of transparent Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 7 mL in sizes A to C, 12 mL in sizes D to F, and 23 mL in sizes G and H. Require liquid bath depth of 280 mm (11 inches).
- Without holder.

Specifications for BS/U-Tube Viscometers

Size	Approx. Constant, mm ² /s ² (cSt/s)	Viscosity Range mm ² /sec (cSt)*

9724-E80 Series

BS/U/M MINIATURE U-TUBE VISCOMETERS

For measurement of kinematic viscosity of transparent Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 2 mL. Require liquid bath depth of 230 mm (9 inches).
- Without holder.

CANNON® SUSPENDED LEVEL VISCOMETERS

9724-F10 Series

BS/IP/SL SUSPENDED LEVEL VISCOMETERS

For measurement of kinematic viscosity of transparent Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 11 mL. Require liquid bath depth of 250 mm (10 inches).
- Holder is not supplied. For holder, see 9726-M99 on page 15.

Specifications for BS/IP/SL Suspended Level Viscometers

Size	Approx. Constant mm ² /s ² (cSt/s)	Viscosity Range, mm ² /sec (cSt)*	Calibrated BS/IP/SL Series

‡ 380 seconds minimum flow time to 1000 seconds.

α Ranges in centistokes represent flow times of 200 to 1000 seconds for all other sizes.

9724-F50 Series

BS/IP/SL(S) VISCOMETERS

For measurement of kinematic viscosity of transparent Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 10 mL. Require liquid bath depth of 230 mm (9 inches).
- Holder is not supplied. For holder, see 9726-M99 on page 15.

SUSPENDED LEVEL & REVERSE FLOW BS/IP VISCOMETERS

9724-G10 Series

BS/IP/MSL MINIATURE SUSPENDED LEVEL VISCOMETERS

For measurement of kinematic viscosity of transparent Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 4 mL. Require liquid bath depth of 305 mm (12 inches).
- Holder is not supplied. For holder, see 9726-M99 on page 15.

Specifications for BS/IP/MSL Miniature Suspended Level Viscometers

11	300	60 000 to 300 000	9724-G80

* Ranges in centistokes represent flow times of 200 to 1000 seconds.

9724-G50 Series

BS/IP/RF U-TUBE REVERSE FLOW VISCOMETERS

For measurement of kinematic viscosity of opaque Newtonian liquids according to ASTM D 445 and ISO 3104. Specifications conform to ASTM D 446 and ISO 3105.

Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.

- Minimum sample volume 7 mL. Require liquid bath depth of 280 mm (11 inches).
- Holder is not supplied. For holder, see 9726-N45 on page 15.

CANNON® VACUUM VISCOMETERS

9724-H50 Series

CANNON-MANNING VACUUM VISCOMETERS

Cannon-Manning Vacuum Calibrated CMVC Series

For measurement of viscosity of highly viscous materials such as asphalt cement at 60°C (140°F) according to ASTM D 2171. Applicable to materials with viscosity range of 0.036 to 80 000 poise. Vacuum of 300 mm Hg is applied to small arm with timing bulbs; two bulbs are incorporated to extend viscosity range of viscometer.

- Minimum sample volume 6 mL. Require liquid bath depth of 180 mm (7.1 inches).
- Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.
- Holder is not supplied. For holder, see 9726-N15.

Cannon-Manning Vacuum Calibrated CMVC-RO Series

Same as 9724-H50 series, but with permanently attached round metal holder, for hole 51 mm (2 inches) in diameter.

ASPHALT INSTITUTE VACUUM VISCOMETERS

Asphalt Institute Vacuum Calibrated AIVC Series

Similar to 9724-H50 series, but with graduated capillary instead of two timing bulbs.

- Minimum sample size 3 mL. Require bath depth of 180 mm (7.1 inches).
- Note: For sizes 400R and 800R, the "roofing" design is normally used for segment B, below, which extends the viscosity range to 1 400 000 and 5 800 000 poise, respectively. See ASTM D 2171, Table X2.
- Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.
- Holder is not supplied. For holder, see 9726-N15.

Asphalt Institute Vacuum Calibrated AIVC-RO Series

Same as 9724-R50 series, but with permanently attached round metal holder, for hole 51 mm (2 inches) in diameter.

9724-R50 Series

CANNON® VACUUM VISCOMETERS & VISCOMETER HOLDERS

9724-W50 Series

CANNON MODIFIED KOPPERS VACUUM VISCOMETERS

Calibrated MKVC Series

For measurement of viscosity of asphalts at 60°C (140°F) in accordance with ASTM Standard D 2171. Applicable to materials with viscosity range of 42 to 200 000 poise. Two-piece design, with sample reservoir and calibrated capillary. Vacuum of 300 mm Hg must be applied to top of capillary tube.

- Minimum sample volume 2 mL. Require liquid bath depth of 178 mm (7 inches).
- Provided with certificate of calibration and instruction sheet. See page 2 for expanded uncertainty.
- Holder is not supplied. For holder, see 9726-N30.

REMOVABLE HOLDERS FOR CANNON VISCOMETERS

All CANNON viscometer holders fit holes 51 mm (2-inches) in diameter. Rubber holders are made of neoprene rubber. Plastic holders hold the viscometer firmly by means of a spring clip. Metal holders are constructed of chrome-plated machined brass and are provided with a handle.

CAPILLARY VISCOMETERS — HOW DO YOU CLEAN THEM?

Clean viscometers are essential if precise and accurate measurements are to be made. Because CANNON receives a significant number of requests for advice about cleaning methods, we offer the following instructions as a guide to cleaning most glass capillary viscometers.

Removing the test sample from the viscometer

The first step in cleaning is to remove the bulk of the test sample. For low viscosity liquids, the viscometer may be turned upside down and allowed to hang while the test sample drains into a trough. For high viscosity liquids, the sample may have to be drawn out under vacuum. The material remaining in the viscometer must then be removed by flushing with a suitable solvent. Distilled water is an obvious choice for aqueous solutions. Petroleum-based lubricants and asphalts can usually be dissolved with light naphtha, heptane, octane, highly aromatic solvents, and many other petroleum-derived solvents. Varsol® is a commercial solvent that works very well for this purpose. For some types of samples it may be difficult to find a suitable solvent.

Highly viscous samples will not easily pour from the instrument nor do they respond well even under vacuum. The best approach is to lower the viscosity by heating the instrument in an open oven or with a stream of hot air. Simply inverting the instrument and suspending it in an open oven over a receptacle to catch the sample usually works well. Another method is to draw the bulk of the sample out while the instrument is at an elevated temperature in a constant temperature bath. This method works particularly well for certain viscometers (such as the Zeitfuchs® Cross-Arm viscometer), as the entire cleaning can

be performed while the viscometer remains fixed in the constant temperature bath. CANNON often places viscometers in an open aluminum oven (2" wide x 7" long x 5" deep), maintained at an elevated temperature, during the cleaning procedure. Even after the bulk of a viscous sample has been removed from the instrument, dissolving the rest of it may pose a considerable problem. We have found that a mixture of octane isomers is especially effective in removing the last traces of high viscosity standards from viscometers.

Drying the viscometer after cleaning

The viscometer must be completely dry before another sample is loaded. Highly volatile solvents are recommended for cleaning since any remaining solvent will evaporate quickly after the sample has been flushed from the viscometer. Often, however, the best choice of solvent for the material in the viscometer is not especially volatile. In this case, a second highly volatile solvent, which will dissolve the first solvent, can be used for the final step in cleaning. Acetone is commonly used as the second solvent because of its high volatility and its ability to dissolve traces of petroleum solvents and water.

A low velocity stream of clean air will be sufficient to evaporate remaining traces of a volatile solvent, but be aware that rapid evaporation of these solvents can cool the surface of the glass to such an extent that humid air may be brought below the dew point, causing a film of water to form on the inner surfaces of the viscometer. Heating the air being drawn into the instrument or heating the glass itself will usually overcome this problem.

Cleaning insoluble deposits from viscometers

Capillary viscometers are often used to measure materials which leave stains or significant deposits of material insoluble in normal cleaning solvents. The most common approach for removing this material involves filling the instrument with a chromic acid cleaning solution and allowing the instrument to soak in the acid for up to 24 hours. Chromic acid solutions are strongly oxidizing and will convert many materials to a soluble form. Chromic acid will not attack the borosilicate glass of the viscometer and thus will not alter the calibration constant. Proper procedures must be followed when using and discarding chromic acid since it is a hazardous material. A commercially manufactured oxidizing reagent (Nochromix®) is chromium-free and may be substituted for chromic acid solutions. Nochromix is available from CANNON.

Beware of glass cleaners with a high pH. Changes in viscometer calibration as great as 20% have been observed due to the prolonged use of alkaline cleaning solutions. If alkaline cleaning solutions with a pH greater than 10 have been used, the viscometer calibration should be verified to ensure that there has not been a significant change.

Insoluble particles stuck in the capillary of a viscometer can sometimes be dislodged by using an ultrasonic cleaner.

If you are encountering a special cleaning problem, we urge you to contact us for assistance.
